

A 3D physics survival game, made in Unity with Claude

HOW IT WAS BUILT

Made by prompting Claude

41
prompts I typed

~8 h
of Claude building and testing

2
days of work

THE FIRST BIG PROMPT

“The player controls a rolling tuna can racing against five AI-controlled objects on a continuously moving treadmill... Stay on the treadmill as long as possible.”

LATER PROMPTS

“where is the stamina bar, also make the different difficultys”

“have 50 agents with varying skill levels test it”

The racers: prompts to 3D models

Every prompt ended the same way: *“Simple stylized 3D game asset, soft realism, clean shapes, minimal detail, smooth materials, polished studio look, toy-like proportions… consistent with casual mobile game art.”*

Canned Bread

“Sealed can of bread lying horizontally on its side, designed to roll. Simple closed cylindrical metal can with silver ridged rims and flat metal lids on both ends. Wrap-around paper label in warm cream and toasty brown, with a simple illustration of a golden loaf of bread in the middle of the label, no text… No bread outside the can, no extra pieces.”

Canned Tuna (the player)

“A horizontal tuna can designed as a rolling prop. It is short, cylindrical, and compact, with a blue label, silver metallic ends, and a simple fish icon on the side… No tuna pieces, no face, and no limbs. The style should match the rest of the set: simple, polished, and game-ready.”

HOW YOU PLAY

Stay on the belt

5 AI difficulties

Easy · Normal · Hard · Expert · Insane. Insane rivals steal pickups and shove you off the edge.

Speed bar

The belt speeds up a level at a time.

Accelerator

Roll straight to build speed; fill the bar for Super Speed.

Stamina

Grab orbs, then hold Shift to boost.

AND MORE

Obstacle Mode & extras

Obstacle Mode: no rivals, just junk flying down the belt. Free Play or a ladder of levels, earning gears.

Also: 12 playable characters, upgrades, arena decor, 14 achievements, a leaderboard, coins and daily rewards.

Tested by 50 AI bots of different skill levels.
